SKIITECH

Secure, Long-Term Data Protection and Storage

As a National Association of Insurance Commissioners (NAIC) Authorized Business Partner, SkiiTech provides insurers with a long-term storage solution for both electronic and paper rate and form filings. With SkiiTech, insurers aren't subject to state-by-state data retention policies – they get easy and instant access to their historical filings for as long as they require.

The System for Electronic Rate and Form Filing (SERFF) is a web-based application that is governed by the NAIC. More than 3,900 insurers use SERFF to streamline state-by-state rate and form filing processes for market entry. By filing electronically, insurers save administrative costs and obtain regulatory approvals faster.

State filings submitted on the NAIC server become the property of that state's Department of Insurance. Such filings are subject to each state's data retention policies, placing insurers at risk of losing their data at any time.

The NAIC selected SkiiTech as its preferred data hosting provider for insurers requiring redundant and long-term storage of their electronic and paper rate and regulatory form filings.

Comprehensive Data Management

SkiiTech's managed data hosting service includes application and platform administration, system maintenance, daily backups (with secure, offsite storage), and version control. As a value-added service, SkiiTech can also set up one or multiple partitions, enabling insurers to segregate filings based on business needs.

SkiiTech's clients are provided with secure and convenient 24x7 access to their historical filings. And, with advanced search and reporting tools, authorized users are able to define, filter, and export data into customizable reports.

State-of-the-Art Data Center

SkiiTech employs redundant, state-of-the-art SAS-70-compliant data centers, which protect both data and equipment with multiple layers of physical and electronic security.

- Dedicated network infrastructure ensures that Internet traffic is instantly and seamlessly routed through the fastest connection path for sub-second application response times.

- Data center access, power, temperature, and humidity level are monitored 24 hours a day by an electronic monitoring system.

- Facility operates redundant electrical power, temperature control and HVAC, fire suppression, and physical security.

- System access is controlled by password authentication and all data is encrypted using Secure Socket Layer (SSL). User passwords are hashed with a non-reversible SHA-2 algorithm. In addition, operations, traffic, performance and data flow are monitored 24x7x365.

Getting Started

For an easy, hassle-free set-up, contact SkiiTech to help complete the three-step process below.

1) Obtain a SERFF license through the NAIC

2) Select the 'per filing' payment option or purchase a block of filings through the NAIC

3) Complete and return the SkiiTech Data Hosting Agreement

SkiiTech offers cost-effective pricing based on the number of filings. Monthly, quarterly, and annual billing options are available.
